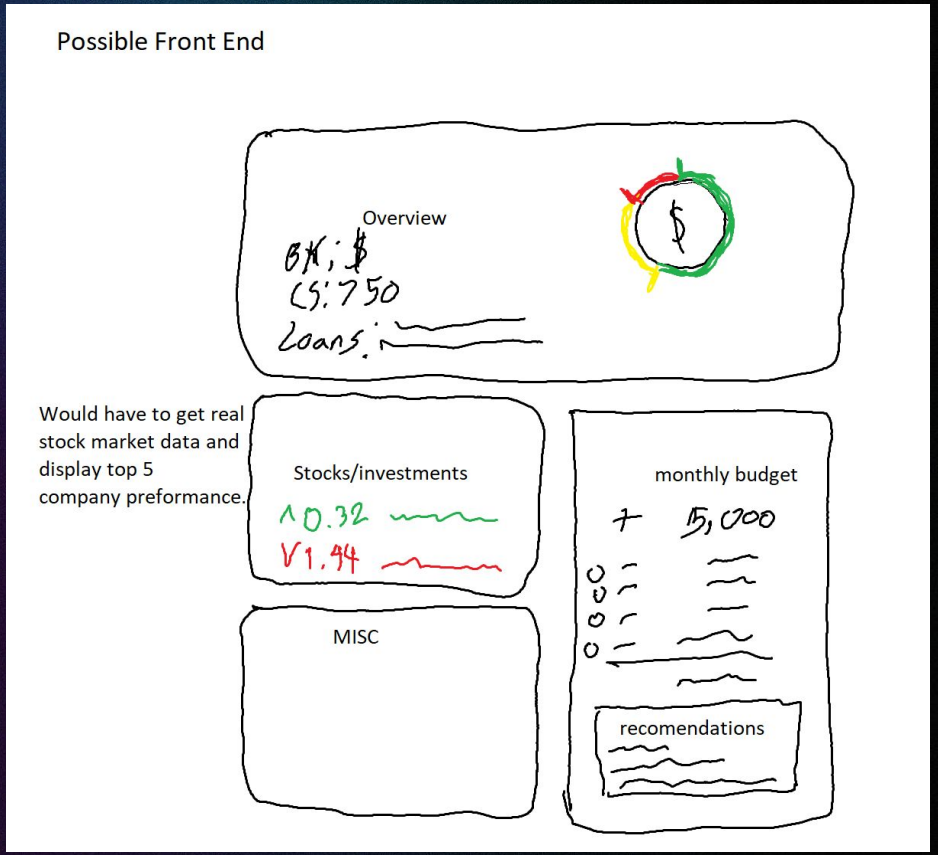
Personal Finance Dashboard

Victor Becker, Aiden Strong, Gabriel Martens

Goal

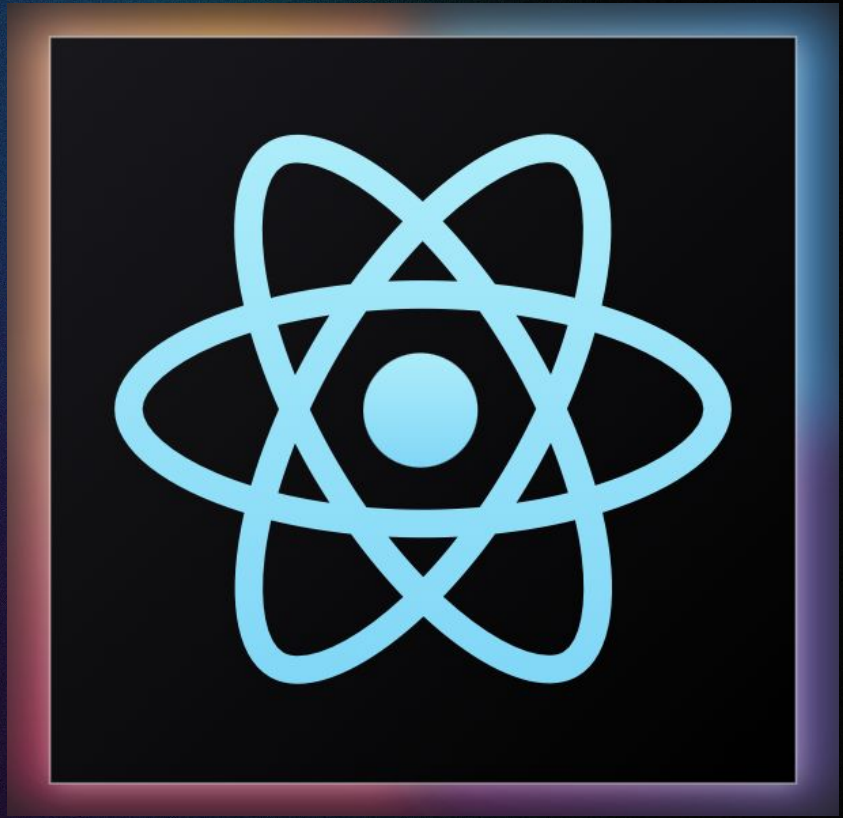
To implement a basic personal finance dashboard using fake user finances to display a functional concept using real world data.



Technologies

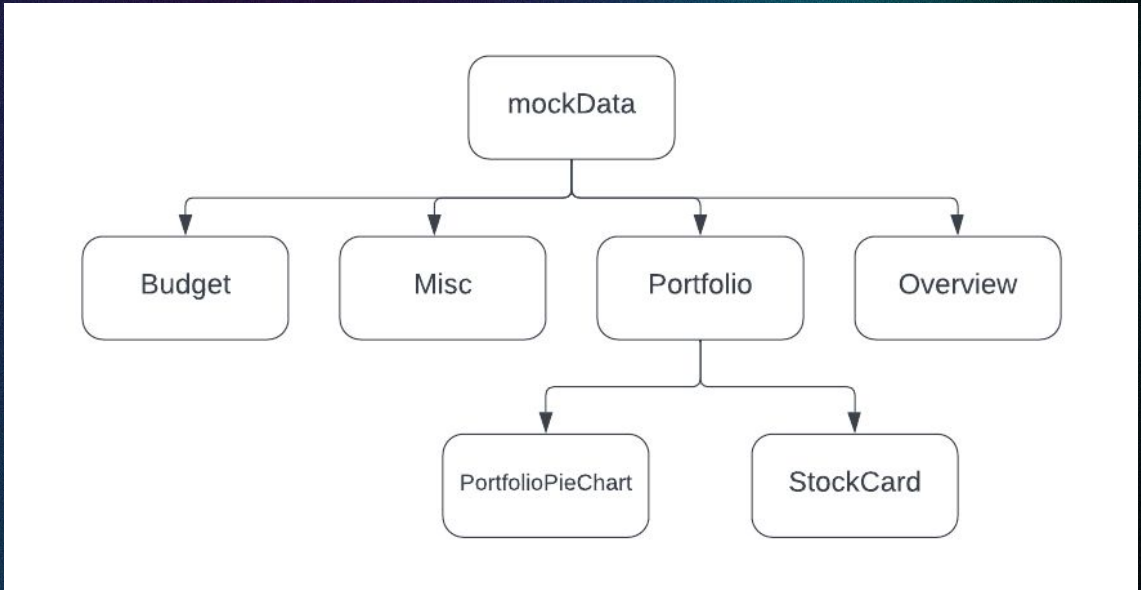
React JS:

- JavaScript library for building UI
- Component-based structure for modularity
- Uses props and state to efficiently manage data



Overview

Instead of creating a database, user data is simulated using the mockData.js data file. This data is then passed into ui components as props and used to populate the user facing components.



APIs and Library

Alpha Vantage: Provides financial data for users suchs as the stocks in our project.

ALPHA VANTAGE

Chart.js: Provides a library to create visually appealing and interactive graphs

Chart.js
